	product available in other colours on request		certyfiat PrüfInstitut Chemische Analytik GmbH
	product approved for food contact (BPA free)		Certyfiat European Union Intellectual Property Office
MOQ	minimum order quantity		

TECHNIQUES USED FOR PRINTING

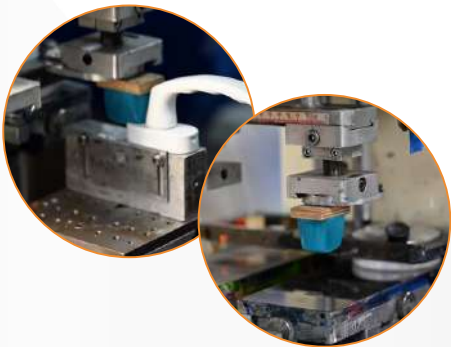

SCREEN PRINTING

The only method for permanent printing on plastics which allows products printed with this technique to be used in the agricultural, chemical, construction and food industries. Our screen printing inks are dishwasher safe, resistant to chemicals and abrasion. The advantage is the ability to print permanently without colour limitation, on any surface size (flat or convex).

PAD PRINTING

A method of permanent and fast printing on plastics, which that allows products printed with this technique to be used in the agricultural, chemical, construction and food industries. This printing technique is recommended for small products with a flat surfaces and limited printing areas with a small number of colours.

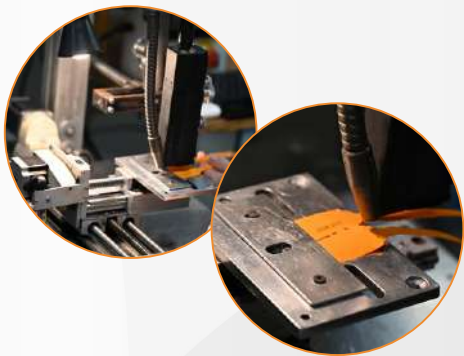

HOTPRINTER

It is a single-color printing technique performed using a heated matrix. The process involves embedding the design along with a layer of ink from a foil in the desired color onto the printing surface. The result is a slightly embossed print, often in metallic colors such as gold or silver. The advantages of this method include the durability and aesthetic appeal of the print, as well as the speed of execution.

INKJET

It is a contactless method of marking the surfaces of various materials by spray-applying colored ink onto a moving product. This technique allows for the permanent printing of not only text but also variable numbering, barcodes, and QR codes.

LASER

Laser printing, also known as laser engraving, is an advanced technology that enables precise and durable marking of various materials, including plastics. This process is based on the use of a laser beam, which, thanks to its high energy concentrated on a small point, thermally modifies the surface of the material.

mounting bracket
on the tube/rod Ø 20-24 mm

Scan

Grid TRAP NET

TRAPNET1
MOQ 100 pcs.

SET CONTAINS:

3 indicators

Principles of use:

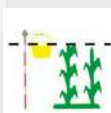

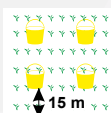

The vessel should be placed on the field just after seeding rapeseed in autumn and after the last snow melts in the spring. Install it approximately 15 m from the field edge, always at the level of the plants' top. It is recommended to use at least four vessels for each plantation.

Pour water with a bit of dishwashing detergent up to the half of the vessel's height. The addition of the detergent will reduce the surface tension of water which will make the pests immerse in it easier.

Monitor the vessel daily, i.e. count the immersed pests and read the pest limit threshold on the table printed on the vessel. Replace water in the vessel each time.

After exceeding the pest limit threshold, decide whether you want to spray the field.

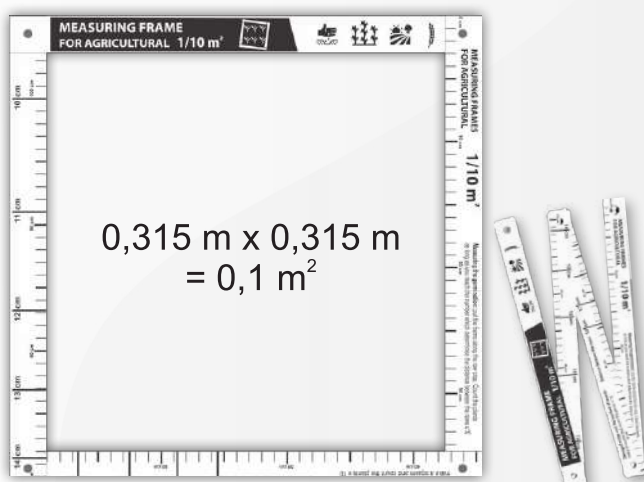

The yellow vessel helps to diagnose the level of harmfulness done by such insects as: ceutorrhynchus, meligethes aeneus and dasineura brassicae.

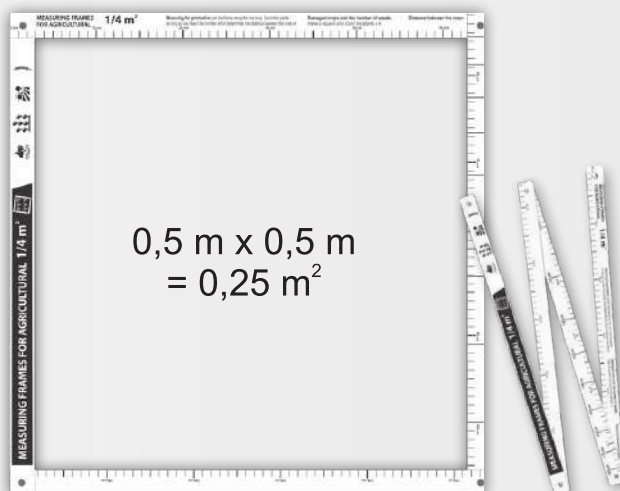

Frame Standard 1/10 m²

RAM00105
MOQ 100 pcs.

Frame Mega 1/4 m²

RAM0010M
MOQ 100 pcs.

Rules for using the FRAME measuring frame:

$(100 \text{ cm} : 18) * 10 = 55,5$

1 Measure the distance between rows using a cm scale. In this case you get a distance of 18 cm.

2 Place the frame along the row and count the plants on a scale based on the distance between the rows. In this case there are 32 plants

3 Multiply the number of counted plants by 10. The result is the number of plants per qm. In this case there are 320 plants / qm

Measuring the germination: put the frame along the row crop. Count the plants as long as you reach the number which determines the distance between the rows x10

Damaged crops and the number of weeds: make a square and count the plants x10

Distance between the rows: 18 cm

18,0

SET INCLUDES:

SLEEVE – FOLD

RAINFOLDOVERLAY
MOQ 100 pcs.

SET INCLUDES:

RAIN FOLD rain gauge with a folding stick in the box facilitating further distribution

Characteristics of FOLD PREMIUM+ Rain Gauges:

- vertical scale up to 40 mm with a measurement accuracy of 0.5 mm of rainfall,
- extended estimated scale up to 70 mm (storm scale),
- two indicators on the funnel (in different colors) for recording weekly, monthly, or annual rainfall,
- the collector allows recording cumulative rainfall up to 250 mm (250 l/m²),
- conical design of the mounting ring ensures optimal positioning of the rain gauge relative to falling rain as a measuring device,
- rain gauge protected by Patent No. 218270,
- rain gauge packaging protected by Industrial Design No. 18572,
- measuring device with a storm scale protected by EUIPO No. 008303481-0001,
- option to add custom printing,

handle assembly

Soil thermometers with a shorter needle (19 cm version) are used for measuring soil temperature (prior to sowing temperature-sensitive seeds) as well as for measuring water temperature (e.g., for calf watering) and air temperature (e.g., in barns).

Agricultural thermometers with a longer needle (40 cm version), on the other hand, are used for measuring the temperature of silage.

The dial of the agricultural thermometer provides an excellent space for printing a logo.

Sealed sample bottles

ONE CAP FITS ALL BOTTLE SIZES

FACTORY OR CUSTOM NUMBERING

FEATURES

- the cap breaks the sealing ring at opening attempt
- prevents access to the contents of the bottle to unauthorized people
- turning force minimum 4.0 Nm

USAGE

- storage of low octane fuel samples like diesel, food products, chemicals
- protection of liquid and loose products
- used by hospitals, laboratories, gas stations, shipyards, sea transport

BENEFITS

- unique numbering guarantees integrity, protects against industrial espionage and forgery
- bottles made material which meets the materials requirements intended to come into contact with food
- very easy assembly without any tools
- different cap colors make it easy to identify samples
- unique numbering allows for better control and ensures the integrity of samples
